PROJECTS

[Stack Overflow clone ↗](#)
Apr 2025 - May 2025

As part of my web development training, I built a front-end clone of the Stack Overflow website using HTML, CSS, and JavaScript. The project focuses on replicating the layout, design, and core UI elements of the original platform. It includes a navigation bar, sidebar, question display section, and footer—all styled to resemble Stack Overflow. I used Flexbox and Grid for responsive layouts and applied JavaScript for basic interactivity. This project helped me understand the structure of real-world web applications and improved my skills in semantic HTML, modern CSS techniques, and responsive web design. It also strengthened my ability to analyze existing websites and recreate them from scratch. This hands-on project was valuable in learning how to convert designs into code and create visually consistent and functional web interfaces. Hosted on GitHub Pages, it showcases my foundational front-end development skills.
